

The **ALA PRESSURE FILTERS** are horizontal plate filters of the most modern construction. They are manufactured in two types, Type 'D' and Type 'E' and they are supplied to a great number of different manufacturing establishments, especially amongst the chemical-pharmaceutical industry, the canning industry and the paint and varnish industry, where they are used for filtration of a great number of various liquids.

The filtration is done under pressure – usually 2 atmospheres above the atmospheric. The pressure is produced by a rotary pump pumping the liquid through the filter. Filter plates (e.g. asbestos plates), filter paper, filter cloth or bronze wire gauge can be used as filtering medium – and filter aid (diatomaceous earth etc.) can be added if expedient.

The ALA standard filters are manufactured having two different heights of the filter rings corresponding with small cake space designated 'L', and great cake space, designated 'S'. They are usable for liquids with a small content of solids respectively for liquids with a greater content of solids.

ALA Pressure Filter
type 'D', size 45–L–9, mobile manufacture.
The filter made from mild steel.

The ALA filter can be supplied in a mobile manufacture. If so the filter tank is mounted on a base plate with castors on which also the pump and motor are mounted. If a mobile unit is not required the filter can be supported by three pipe-legs and in such cases the motor and the pump are mounted on a special joint base plate.

ALA Pressure Filter, type 'E', size 45-L-13, mobile manufacture. The filter is made from stainless steel.
